DIE BASAALMETABOLISME-SNELHEID VAN BLANKE MANS

J. BOUYENS en K. C. HOLEMANS, *Departement van Fisiologie en Biochemie, Universiteit van Pretoria, Pretoria*

In 'n vorige verslag, waarin 'n vergelyking getref is tussen die basaalmetabolisme-snelheid (B.M.S.) van plaaslike Blanke en Bantoeverpleegsters met dié van Britse vroue, is dit onder andere bevind dat die B.M.S. van die Blanke verpleegsters nie betekenisvol verskil het van dié van die ooreenstemmende ouderdomsgroep in die Britse vroubevolking nie. Die moontlikheid is, in die vooruit sig gestel dat, indien mans bestudeer word en weer eens geen statistiese verskil tussen die B.M.S. van plaaslike persone en Britse gevind word nie, die Britse standaard vir B.M.S. van Robertson en Reid hier gebruik sal kan word. Derhalwe is die B.M.S. van 'n verdere 102 Blanke mans tussen die ouderdomme van 19 en 23 jaar bepaal en statisties vergelyk met die ooreenstemmende ouderdomsgroep van die Robertson en Reid-standaardgroepe van die Britse bevolking.

Proefpersone en Metode

102 fisies-gesonde Blanke mediese studente het as proefpersone opgetree. Die volgende prosedure is doorgaans gebruik: Alleen in ligte, lae, proteïenmaatyd is gedurende die aand voor die bepaling deur die proefpersone genuttig. Die volgende oggend is die proefpersone, voordat enige voedsel of vloeistof ingesom is, na 'n metaboliese kamer geïntermeer waar hulle dan 2 uur lank rustig gelê het voordat die bepaling gedoen is. Presies dieselfde prosedure is hierna gevolg as wat in die vorige ondersoek die geval was.

Resultate

In Tabel I word die gemiddelde waardes vir lengte, gewig, liggaausoppervlakte en B.M.S., sowel as die getal proefpersone in elke ouderdomsgroep, aangegee.

TABEL I. GEMIDDELDE LENGTE, GEWIG, LIGGAAUSOPPERVLAKTE EN B.M.S. EN DIE GETAL PROEFPERSONE IN DIE VERSKILLENDE OUDERDOMSGROEPE\*

Ouderdom (jaar)	Getal	Lengte (duim)	Gewig (lb.)	Liggaausoppervlakte (A <sup>2</sup> )	B.M.S. (Kal./m <sup>2</sup> /uur)
19	28	70-39 (2-2)	155-59 (15-7)	1-88 (0-35)	38-72 (2-16)
20	34	70-95 (1-91)	166-51 (16-86)	1-94 (0-30)	38-81 (2-99)
21	24	70-77 (1-53)	167-42 (17-43)	1-94 (0-11)	37-99 (2-24)
22	9	70-27 (1-23)	172-57 (22-36)	1-96 (0-10)	33-50 (1-77)
23	6	69-35 (2-37)	156-60 (21-25)	1-35 (0-15)	37-85 (1-86)

\* Standardafwykings word tussen hakies aangegee.

Die regressielyn vir B.M.S. op ouderdom is bereken; die regressie-vergelyking  $y = 43.3373 - 0.2392x$  is gevind van toepassing te wees op die proefgroep. Voorts is die regressielyn vir Britse mans tussen die ouderdomme 19 en 23 jaar uit die standaardwaardes van Robertson en Reid bereken. In hierdie geval is die regressie-vergelyking  $y = 47.554 - 0.465x$  van toepassing gevind. Die variëte vir die bepaling het 5.777 vir Suid-Afrikaanse mans en 5.733 vir Britse mans beloop.

Ten slotte is die regressie-koeffisiënte vir Suid-Afrikaanse Blanke mans statisties met die vir Britse mans vergelyk. Geen betekenisvolle verskil tussen hierdie regressie-koeffisiënte is gevind nie.

BESPREKING

Uit die vergelyking tussen die B.M.S.-waardes van plaaslike Blanke mans met dié van Britse mans in dieselfde ouderdomsgroep, is dit duidelik dat die Britse standaardwaardes vir B.M.S. vir die betrokke groep plaaslik gebruik kan word. In 'n vorige ondersoek is dit aangetoon dat die gemiddelde B.M.S.-waardes van lokale Blanke vroue ook nie statisties betekenisvol van die ooreenstemmende groep in die Britse bevolking verskil nie.

Die twee lokale proefgroepe, in die geval van mans, sluit slegs die ouderdomme 19-23 jaar, en in die geval van vroue slegs die ouderdomme 18-26 jaar in.

Vir hierdie ouderdomsgroepe is die Britse standaard gebruik van toepassing. Verdere studies sal bepaal of in die geval van laer en hoër ouderdomsgroepe dieselfde gevolgtrekking geregtig sal wees.

Aangesien dit eger welbekend is dat 'n uniforme afname in B.M.S. met ouderdom in verskillende bevolkingsgroepe intree, kan ons verwag dat die Britse standaard ook vir ander ouderdomsgroepe in die Suid-Afrikaanse bevolking van toepassing sal wees.

OPSUMMING

Die B.M.S. van 102 Blanke mans tussen die ouderdomme 19-23 is bepaal. Dit is gevind dat die B.M.S.-waardes van plaaslike Blanke mans nie statisties betekenisvol verskil van die standaardwaardes van Britse mans in dieselfde ouderdomsgroepe nie. Die gevolgtrekking word gemaak dat binne bogenemde ouderdomsgroepe Britse B.M.S.-standaarde plaaslik aangewend kan word.

RESEARCH FORUM

MESOTHELIOMA OF PLEURA OR PERITONEUM AND LIMITED BASAL ASBESTOSIS\*

J. G. THOMSON M.D., *Department of Pathology, Medical School, University of Cape Town, Observatory, Cape*

Mesothelioma is now accepted by the majority of pathologists as an entity, and in recent years diffuse or malignant mesothelioma has been shown to be associated with pulmonary asbestosis in Canada, Holland, South Africa, and Germany. All these cases were primary in the pleura and in subjects who had worked with asbestos in mines or asbestos factories, or who lived in areas where asbestos was mined or treated. In the autopsy service of one teaching hospital we have

encountered 7 examples of mesothelioma, 4 in pleura and 3 in peritoneum, all but one in the last 3 years. None had had asbestosis clinically or radiologically where such examination was done, and only one patient had a history of occupational exposure to asbestos. At autopsy in all, the lungs did not show the appearances of asbestosis, but careful examination revealed scattered small carbon-pigmented foci of fibrosis in the basal 1 cm. or so of the lower lobes. These lesions were inconspicuous and readily overlooked, but in 6 of them the microscopical picture was that of pulmonary asbestosis.

\* Abstract of a paper presented at the Research Forum, University of Cape Town, on 14 June 1962.

with prominent asbestos bodies. Sections from elsewhere in the lungs showed no asbestosis and usually no asbestos bodies. In the one case where no asbestos bodies and no basal asbestosis was demonstrated, a section appeared to have been taken of the base of a lung, and though no smears were taken from this area to look for asbestos bodies, we must regard this case as not having the basal asbestosis.

Six were males and 1 was a female. Two were in their late thirties, the one with a 15-year history of working in asbestos mines and the other a builder. One was 46, and the remaining 4 were over 60 years of age. Two were Native Africans, 2 Coloured, and 3 Whites. From the pathological point of view they did not differ from other reported cases of mesothelioma; 4 were examples of mixed sarcomatous—carcinomatous type, and one each of sarcomatous, carcinomatous and anaplastic types.

It is suggested that gravity and lung movements, determining the basal accumulation of inhaled asbestos fibres, which then become asbestos bodies and attain locally a carcinogenic concentration. This is effective on the basal pleura or the peritoneum over the diaphragm, which is only a few millimetres distant. The usual neoplastic response to asbestosis is bronchial carcinoma, but an increasing number of cases of mesothelioma in ordinary industrial asbestosis are being reported. In the region of this limited basal asbestosis there are no bronchi with glands, only bronchioles, and bronchial carcinoma is not to be expected.

That the association of a limited basal asbestosis and mesothelioma is not confined to South Africa is shown by the finding of a basal asbestosis in 9 patients with mesothelio-

ma, examined personally in 1961 in 4 centres in the United States, out of 15 in whom adequate lung was available for study. In all but 2 of them the basal asbestosis had been overlooked.

The two factors against recognition of this association are the reluctance of some pathologists to diagnose mesothelioma and the failure to see or recognize the limited asbestosis which will also be missed microscopically unless sections are taken from the lung bases.

The enormous increase of the world consumption of asbestos, and its use in a wide variety of industrial products, makes it possible for an increasing number of people manufacturing, handling, or using these products to inhale enough asbestos fibres to produce this limited basal asbestosis, without having any clinical or radiological evidence of it. In modern home asbestos may be present, from the roof—a asbestos tiles or roofing, in ceilings, in floor tiles, in insulation in electrical equipment such as electric fridges—to the asbestos-insulated pipes in the basement. It may well be that the home hazard from asbestos is theoretical rather than practical to the occupant, but it may not be so to the builder. It does indicate, however, how widespread is the use of asbestos today, and while the number of cases of classical asbestosis with pulmonary signs and symptoms may not significantly increase, we may have a marked increase in those with the limited basal asbestosis described, and of mesothelioma of pleura and peritoneum in people who have occupations in which association with asbestos is not suspected. This may well be the explanation why 6 cases of a rare tumour were encountered in the autopsy service of one hospital in 3 years.

MEDICAL SERVICES PLAN

REPORT BY THE CHAIRMAN, DR. M. SHAPIRO, TO THE THIRD ANNUAL GENERAL MEETING

I have pleasure in presenting to you the Third Annual Report of Medical Services Plan. This report covers the period 1 January to 31 December 1961.

The balance sheet shows that at the close of the year under review the capital account stood at R36,533, which represents the balance of R16,199 brought forward from the last balance sheet plus the sum of R20,334 which was the excess of revenue over expenditure for the year. The Plan holds as additional reserve the capital sum of R15,000 which is the aggregate amount of loans of R20 each subscribed by the 750 participating doctors in the Plan. As at the date of the close of the balance sheet, the cash resources at the bank in savings account and on fixed deposits amounted to R103,080.

The income for the year was R253,218 being R256,756 from subscriptions and R1,462 from interest on investments. The expenditure amounted to R237,864 made up as follows: R202,864 (equivalent to 79% of subscription income) was allocated for medical services and hospitalization. Of this amount, R145,501 had been paid as at 31 December 1961. A further R42,363 had been set aside for claims approved but not yet paid at the closing date of the period under review, and R15,000 was earmarked as an estimated provision for benefits for services rendered during the year, but for which accounts were not yet to hand at 30 December 1961. Administration expenses for the year amounted to R53,933 which is 13.2% of subscription income. This is somewhat less than last year and reflects a continuing trend of economy in the administration of the Plan.

The remarkable growth of subscriber membership and of monthly subscription income is shown in the following Tables:

In order that members may be brought up to date with the latest position, the figures for the first 6 months of the current year have also been included.

The rapid and sustained increase in the membership of the Plan is eloquent testimony of the need which exists for insurance against the cost of illness and of the appreciation by the public of the advantages of the very comprehensive cover offered by the Plan.

The surplus of subscription income over expenditure for benefits and administration expenses was 7.8% of the subscription income. In view of the fact that more than half the total membership of the Plan was enrolled during the year under review, it is apparent that services have been demanded and rendered on a most generous scale. As members know conditions from which subscribers are already suffering on the date of their admission to the Plan are excluded from benefits, it follows therefore that the incidence of costly illness for which the Plan is financially liable must be substantially less in the initial stages of membership than it will be later. A surplus of only 7.8% at this early stage of the development of the Plan is viewed by your Board with grave concern, since it is clearly inadequate to provide the substantial reserves which will be necessary to safeguard the future interests of the members. I should like to take this opportunity to warn subscribers that demands for services other than are justifiable and necessary may have to be compensated for by increased premiums or by reduction of benefits.

In this connection, I feel it my duty also to quote the following from the subscriber's contract with the Plan: "It is the intention of the Plan to provide comprehensive medical

	31 Dec. 1960	30 June 1961	31 Dec. 1961	30 June 1962
